

AthDGC · Athens-PROIEL

An open diachronic Greek treebank with Indo-European parallels

Nikolaos Lavidas

June 10, 2026

The **Athens Digital Glossa Chronos** (*Athens-PROIEL (the dependency-treebank (a collection of sentences whose grammatical structure has been analysed and stored) standard for early Indo-European languages, developed at Oslo)*) is an open PROIEL-style dependency treebank spanning Greek diachrony with Indo-European parallels.

NKUA · Division of Language-Linguistics, Department of English Language and Literature, School of Philosophy

Funded by HFRI (Project No. 20577) · Greece 2.0 NRRP

AthDGC is **both** a continuously-updated **PROIEL XML 2.0** (the file format that stores each sentence as a tree of word-by-word grammatical relations, developed at Oslo) treebank **and** an open-source **computational diachronic-linguistics toolkit**:

- LightSIDE (an open-source text-mining workbench developed at Carnegie Mellon)-compatible feature extraction + classifier training
- NoSketch-style concordancer (a search tool that shows every occurrence of a word in its surrounding context)
- Fine-tuned (further trained on new data to adapt it to a particular text type) Stanza (Stanford's open-source Python workflow that automatically tags, lemmatises, and parses sentences) checkpoints (Byzantine, Late-Byzantine, Modern adaptations)
- Argument-structure extractor
- Cross-lingual alignment (matching corresponding words or sentences between

Covers:

- Homeric and Archaic Greek (Homer, Hesiod, Sappho, Pindar)
- Classical (Aeschylus, Sophocles, Euripides, Aristophanes, Plato, Aristotle)
- Koine and NT (Plutarch, Strabo, Lucian, the New Testament)
- Late Antique (Eusebius, Basil, Chrysostom, Procopius)
- Byzantine (Psellos, Anna Komnene, John of Damascus, Niketas Choniates)

with **NT verse-level cross-alignment** to Latin (Vulgate), Gothic (Wulfila), and Old Church Slavonic (Marianus).

Current state (v0.4)

Metric	Value
Greek periods covered	8 (Archaic - Modern)
IE cross-aligned witnesses	4 (Latin Vulgate, Gothic Wulfila, OCS Marianus, Classical Armenian in ingestion)
Per-witness verse counts	v0.5 release notes (post-ARIS audit)

1. **Discovery**, daily harvest from archive.org, Perseus, First1K, Wikisource, Diorisis
2. **Filtering**, Greek-script ratio, apparatus-criticus rejection, dedup
3. **Conversion**, PROIEL XML 2.0
4. **Annotation**, Stanza `grc_proiel` + analogous models per parallel language
5. **Argument-structure**, subject, object, oblique, voice, aspect per verb
6. **Cross-alignment**, LaBSE (a multilingual sentence-embedding model that maps sentences from many languages into a common vector space) + AwesomeAlign (a word-alignment procedure that uses multilingual-BERT attention to match words across translations) (mBERT)
7. **Storage**, PROIEL XML + JSONL (a plain-text data format that stores one record per line) + Qdrant + Neo4j

- **Retranslation** of influential texts (Iliad, NT, Septuagint Psalms, classical historiography)
- **Retelling** chains across periods and languages
- **Argument structure** (the set of obligatory and optional partners a verb requires, e.g. subject, object, oblique) under retranslation
